Date : 07/06/2011

Name : KHAIRUL ANSHAR

NRIC : G6074816R

Sex : Male Age : 31

Clinic Visit No : 0611012343

Registration : 11-158-188

Referring Doctor : Yang Tze Yi Steve

Referring Clinic : Internal Medicine Centre - Soc

Performing Centre : Radiology (Raffles Hospital)

CT THORAX

CT of the thorax was performed with IV contrast administration.

Compared to the scan of 21 May 2011, there is marked interval reduction in the size of the loculated left pleural collection. There is an isolated 1.0 cm pocket seen in the same vicinity with mild rim enhancement. Associated left lower lobe round atelectasis and consolidation is seen. This has however resolved significantly since the last scan. No other significant abnormality is seen in the lung parenchyma. The intra-pulmonary vasculature is normal. There is no significant mediastinal or axillary adenopathy. The heart and the great arch vessels are unremarkable.

COMMENTS

There is significant interval reduction in the size and extent of the lower left thoracic collection. A small localised collection with rim enhancement (? loculated empyema) is seen in the same area.
